## MAX IP & MAXATTACH IP v4.0 RELEASE

### September 1, 2010

ClearOne is pleased to announce a major product release for the MAX IP and MAXAttach IP conference phones. Version 4.0 has incorporated major feature enhancements into the product associated with SIP capabilities.

Upgrades include:

- VoIP Security - SRTP and TLS have been added to the MAX IP product allowing full encrypted audio capabilities on your VoIP infrastructure.
- Failover Proxy Registration Capability - Version 4.0 has implemented a dual proxy registration method. The failover proxy registration function allows automatic switching to a secondary proxy after failure on the primary proxy.
- Domain Name Server (DNS) - DNS capability has been added to the MAX IP allowing name-based identification of VoIP devices on the network.
- Improved Configuration & Programming - Additional functions were added to the configuration file making network-based TFTP updates easier to accomplish on the enterprise.

Interoperability testing included Cisco Call Manager 7.0 and Avaya Communication Manager 5.1.

Existing MAX IP & MAXAttach IP units currently in the field can be upgraded with the Version 4.0 software. Just follow the procedures outlined in the MAX IP Firmware Upgrade Tech Note.
